

WOOD SMOKE IS RICH IN DIOXINS and PCBs

“Dioxins are byproducts of paper bleaching, smelting, and waste incineration. They are widespread in the environment because they break down very slowly. They also accumulate in fat cells. Most of our exposure to dioxins comes from eating dairy products, fish, and meat.” (National Cancer Institute, US National Institute of Health)

Notice—no mention of wood smoke. Why???

Wood smoke is rich in chlorinated dioxins and PCBs, toxins that disrupt our endocrine systems and the way our bodies work. When smoke falls to the ground, dioxins get into the water and into the food chain along with cadmium, lead, arsenic and other poisons. First we breathe the bad chemicals—then we eat them.

Dioxin is a potent carcinogen and endocrine disrupter. Scientists say it is exceeded in toxicity only by radioactive waste. (US East Coast Ash for Radioactive Wood Ash)

deadly air pollutants. It is a repeat offender and keeps getting recycled in the environment for years. It lasts in the human body for seven years after exposure.

Illustration below is from the National Cancer Institute Website, www.cancer.gov.

Wood burning is the third largest source of dioxin in the United States. (California Air Resources Board, 1999) **In the San Francisco Bay Area residential wood burning is the second largest source of dioxin** and accounts for as much dioxin as 100 factories and industrial sites, including landfills, incinerators, foundries, cement kilns, coke ovens and hazardous waste furnaces. (Meltzer, Lawrence Livermore national Lab 2001 Report) San Francisco wood burning is estimated to produce 0.424 grams of dioxin per year. Compare to nonspecific source fires at 0.097 grams of dioxin per year, or hazardous waste incineration at Shell and Chevron of 0.063 grams of dioxin. (California Air Resources Board, 1999)

Dioxin Poisoning September 5, 2004, Ukrainian opposition leader and presidential candidate Victor Yushchenko was **poisoned with a near lethal dose of Dioxin** thought to have been placed in the food and/or beverage of his evening meal. His face is now ravaged, as you can see in pictures from the following abridged article.

Ukrainian Candidate Poisoned By Dioxin

Doctors In Vienna Confirm Diagnosis of Yushchenko's Illness; Police Reopen Case

By ELISABETH ROSENTHAL, Published on 12/12/2004. [Abridged]

London (NYT) — Tests done at a hospital in Vienna, Austria confirmed that Viktor A. Yushchenko, the Ukrainian opposition candidate, **had been poisoned with dioxin**, doctors there said Saturday, providing an explanation for a broad array of painful and disfiguring conditions that plagued him during the past three months of the presidential campaign. Dioxin, a waste product of various industrial chemical processes, is a highly toxic chemical that **remains in the body for years after exposure**, so doctors were able to test their patient Friday, long after the near-fatal poisoning occurred. Initially the poison often produces severe abdominal pains, nausea and vomiting — and, in the long term, very high doses can produce the kind of skin

The picture combo shows Viktor Yushchenko in file photos dated March 28, 2002, left, and Dec. 6, 2004, right. The Ukrainian opposition leader and presidential candidate's mysterious illness that scared his face was caused by dioxin poisoning, doctors said Saturday in Vienna, Austria.

cysts and discoloration that have disfigured Yushchenko.

..dioxin exposure most often comes from industrial accidents where it is inhaled or absorbed through the skin--
